

Contrast vs. Camera

Detectability Index vs. Camera

Graph 5. Contrast and detectability for the three smallest spheres (4, 5, 6) for all cameras under the best conditions. These correspond to the best images shown in Fig 1, 2 and 3. ADAC failed to visualize the two smallest spheres but otherwise had comparable or better contrast than the other units. This indicates that other factors, such as spatial resolution are influencing the results.
